Verify Account: UI

Hey! Hope you have been learning amazing stuff. Previously, you have learned and worked on HTML & CSS. We know you must be dying to make some super cool stuff. But first try to make this simple UI design.

Take a look at this screen:

- Remember that HTML CSS is all about structuring & figuring out how to layout the page. Now take another look and think how you'll create this **centre-aligned** screen.

- Divide this entire screen into divs (or sections if you want to try out HTML5!) & paragraphs.

- Notice how the box is styled with a border & border radius. You can do this too using CSS!

- Some text is made using Heading tags, there are many such heading tags, search about them and try them out to find your favourite!

- Now let's take a look at the OTP field:

  - It has **two types of styling,** Active & Inactive.

  - Think or read about CSS pseudo-selectors that can be used here whenever you click on each element.

  - Implement those pseudo selectors to create this simple and elegant UI!

Now you can use this UI in the projects you make later on!
